

ABSTRACT OF THE DISCLOSURE

*Buy
a1*

~~An iodine-PVA polarizing element 30 μ m thick is dried~~
by heating at 50°C for 30 minutes to thereby obtain a polarizing
element having a moisture content of 4.9 % by weight. A pair
of 100 μ m-thick norbornene resin films (tradename "ARTON" made
by JSR Corporation) used as protective films are stuck to
opposite surfaces of the obtained polarizing element through
layers of PVA adhesive agents which are applied on the pair
of norbornene resin films respectively and dried. Thus, a
polarizer is obtained.
